

See the real benefits of window film before you buy

Most homes and businesses have an area where solar heat and glare present a tough challenge. Often it's your living room or front office, where you spend most of your time.

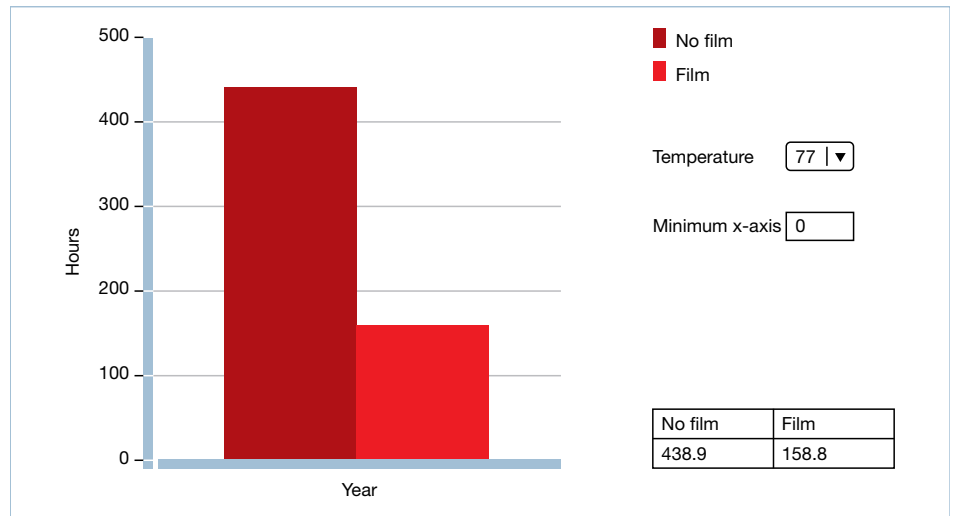

Intense heat makes these rooms uncomfortable and increases your air conditioning costs. You, your family, and your furnishings are also exposed to damaging ultraviolet light.

Specularis™ shows measurable improvements

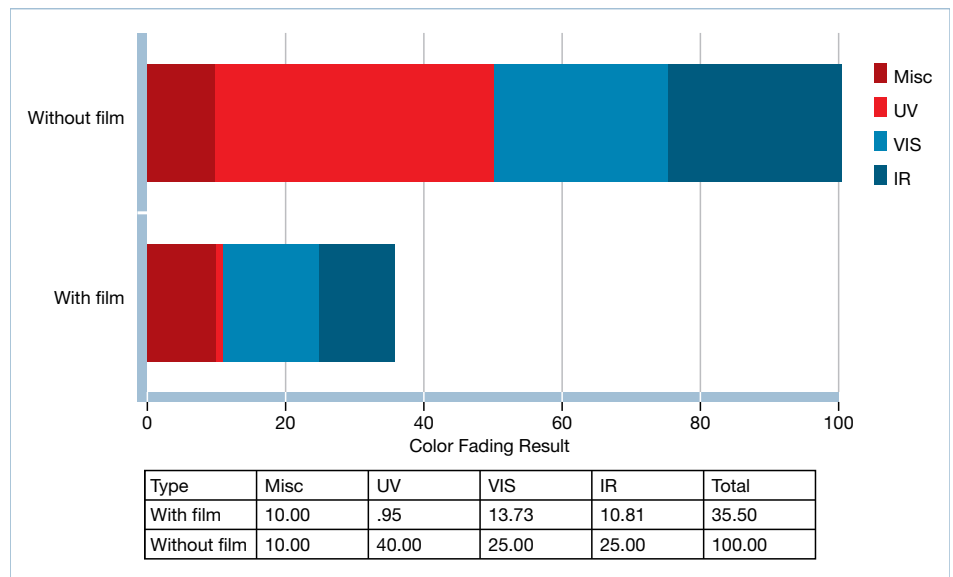

Specularis™ is a web-based energy analysis and film selection tool your official dealer can use to give you an accurate assessment of improved comfort and reduced energy consumption. You'll also see how window film protects you and your furnishings from harmful effects of the sun, particularly UV rays.

To create your custom analysis, your Panorama® dealer first inputs data about your home, including the floor plan of your room, size and location of windows, north/south orientation, types of windows, even wall construction materials. Then Specularis™ accesses local climate data and utility costs. It also considers your particular concerns, such as reducing glare or preserving a view, before recommending which Panorama® window film is right for you.

Ask for your custom comfort and energy analysis today.

Comfort temperature calculations — Specularis™ estimates how many hours your home remains at a comfortable temperature, with and without air conditioning

Impact of fading — Specularis™ shows effects of the sun with and without window film
